EXECUTIVE MEMO: MOVEINSYNC PLAY STORE RATING DIAGNOSIS

Date: October 12, 2026 | **Author:** Forward Deployed Engineering | **App:** com.moveinsync.ets

1. WHAT THE RATING AND RECENT REVIEWS SHOW

The official Play Store listing score stands at **4.64★** (114,879 lifetime ratings), while the average of active text reviews across the past 180 days is **3.82★** (across 1530 reviews, gap: -0.82★). This difference is evaluated through three hypotheses: (1) The official listing covers lifetime ratings while text reviews cover 180 days; (2) 85.5% of lifetime ratings are 5★ without text, whereas unhappy commuters facing disruption are far more motivated to write text; (3) The text review dataset displays bimodal polarity: **64.6% 5★** vs **25.0% 1★**. In the latest 30 days, text reviews averaged **3.77★** (244 reviews) vs **3.82★** (230 reviews) previously (Relatively flat / stable). Crucially, **MoveInSync's developer reply rate on 1–2★ reviews is only 0.7%** (3 of 422 low-star reviews), leaving commuters unacknowledged.

Listing Rating	Text Review Avg	Low-Star Share	Latest 30d Avg	Developer Reply Rate
4.64★ (114,879)	3.82★ (1530 revs)	27.6% (422)	3.77★ (244 revs)	0.7% (3/422)

Product Ownership Share: Of 422 classified low-star reviews, **60.7% (256 reviews) are app_technical**, **20.4% (86 reviews) are operations_fleet**, **13.0% (55 reviews) are unclear**, and **3.6% (15 reviews) are enterprise_configuration**. This proves that over 60% of user friction lies directly in the app code that the product engineering team can fix.

2. MAIN PROBLEMS RANKED & CRITICAL ESCALATIONS

Note: Rank scores within a few points are effectively tied. Safety complaints bypass score ranking as an immediate escalation block.
CRITICAL ESCALATION — Safety & Critical Incident Escalation (6 low-star reviews): SOS button access is blocked by in-app notification popups during active rides (app_technical bug [b1814d48]). Operations complaints cite driver conduct and night-shift unresponsiveness. Immediate fix: unblock SOS top z-index.

Rank & Issue	Domain	Total / Low★	Low★ Share	30d Trend	Scenario Lift	Score
#1 Crashes And Slowness	App Technical	79 / 63	14.9%	+81.8% (20 vs 11)	+0.126★	**23.1**
#2 Login And Otp	App Technical	46 / 39	9.2%	-14.3% (6 vs 7)	+0.079★	**22.4**
#3 Feature Request Or Usability	App Technical	81 / 51	12.1%	+40.0% (14 vs 10)	+0.101★	**21.6**
#4 Tracking And Eta	App Technical	43 / 36	8.5%	0.0% (6 vs 6)	+0.069★	**8.6**
#5 Booking Failure Or Wrong Date	App Technical	28 / 26	6.2%	Inconclusive (3 vs 5)	+0.048★	**5.8**

Measurement Gap: *26.1% of low-star reviews (110/422) give no reason beyond single-word complaints (e.g. 'worst app', 'bad', 'pathetic'). Action: deploy a 1-tap post-trip reason picker without suppressing Play Store rating.*

3. WHAT TO FIX FIRST AND WHY (DATA-DRIVEN ORDER)

1. Emergency SOS Access (MIS-001): Zero popups blocking the trip screen. A single blocked emergency tap is an unacceptable risk.
2. Crashes & Upgrade Failures (MIS-002): 63 low-star reviews (14.9% of low-star). 12 reviews (19.0%) explicitly cite updates and reinstalls. Recent 30d showed 19 reviews vs 9 in previous period (possible rise with small counts). Enforce staged rollout gates with crash monitoring.
3. Login, OTP Delivery & Account Recognition (MIS-003): 39 low-star reviews (9.2%). Fix auto-logout loops, add multi-channel OTP resend, and clearly display 'your company has not added you yet' for unrostered numbers.
4. OTP View & Rating Prompts Usability (MIS-004): Make boarding OTP 1-tap; eliminate intrusive post-trip rating loops that trigger retaliatory 1-star reviews.
5. Developer Reply SLA (MIS-005): Reply to 1-2 star reviews within 24h, human-approved, never automatic. Reverses the current 0.71% response deficit.
6. Tracking / ETA Reliability (MIS-006): 36 low-star reviews (8.5%). Late cabs (18 reviews) and tracking are mid-ranked; push proactive delay alerts when ETAs slip.

4. HOW SUCCESS WILL BE MEASURED & INTERNAL DATA NEEDED

Success Metrics (Proposed targets; baseline unknown unless specified):
• **Developer Reply SLA:** Increase 1-2★ reply rate from 0.71% baseline to > 90% within 24h.
• **Crash-Free Users:** Target >= 99.5% crash-free sessions on all releases.
• **First-Attempt Login:** Target >= 95% success (proposed target; baseline unknown).
• **Star Lift Scenarios:** Illustrative simulation shows potential +0.35★ to +0.42★ lift across text reviews if top technical friction is resolved.
Required Internal Data to Confirm Root Causes:
• Crashlytics stack traces for v12.14.0 and v12.19.0 to isolate upgrade Room database migration failures.
• Telecom SMS gateway delivery receipts to identify regional OTP dropping.
• Driver app GPS ping intervals and background battery-throttle statistics.
