MOVEINSYNC ENGINEERING ACTION PLAN & SPRINT SPECS

Product specifications, acceptance criteria, and 14-day sprint roadmap

SPEC #1: SAFETY COMPLAINTS

Domain / Owner:	Operations Fleet | Head of Safety & Compliance + Mobile Security Lead
Effort / Star Lift:	Large Effort | Scenario: +0.011★
Hypothesis:	Hypothesis: Night-time cab drops or female employee commutes encounter unverified driver substitutions, escort guard absenteeism, or SOS button unresponsive states.
Proposed Change:	Zero-tolerance safety workflow: Enforce driver facial verification before trip start, mandatory OTP verification before car rolls, 1-tap SOS that immediately rings transport security room, and auto-call female employees after drop.
Acceptance Criteria:	1. Driver selfie match required every 12 hours or before shift. 2. SOS button in persistent notification bar accessible even on lock screen. 3. Drop confirmation auto-call triggers for female night shifts.
First 14 Days:	Immediate Day 1: Audit all reviews flagged with safety. Days 2-5: Review 24/7 security control room call routing. Days 6-14: Implement persistent lock-screen SOS widget.
Telemetrics to Measure:	SOS response SLA (< 30 seconds), zero unresolved safety escalations.

SPEC #2: GENERIC COMPLAINT WITH NO DETAIL

Domain / Owner:	Unclear | Unclear Lead
Effort / Star Lift:	Medium Effort | Scenario: +0.214★
Hypothesis:	Hypothesis: Systemic friction in Generic Complaint With No Detail driven by lack of feedback loops.
Proposed Change:	Refactor user journey for Generic Complaint With No Detail with clear UX feedback and robust backend retry.
Acceptance Criteria:	Resolve root cause of Generic Complaint With No Detail complaints with verifiable regression tests.
First 14 Days:	Audit telemetry, formulate test fix, and roll out canary release.
Telemetrics to Measure:	Reduction in Generic Complaint With No Detail complaints.

SPEC #3: CRASHES AND SLOWNESS

Domain / Owner:	App Technical | App Technical Lead
Effort / Star Lift:	Medium Effort | Scenario: +0.126★
Hypothesis:	Hypothesis: Systemic friction in Crashes And Slowness driven by lack of feedback loops.
Proposed Change:	Refactor user journey for Crashes And Slowness with clear UX feedback and robust backend retry.
Acceptance Criteria:	Resolve root cause of Crashes And Slowness complaints with verifiable regression tests.
First 14 Days:	Audit telemetry, formulate test fix, and roll out canary release.
Telemetrics to Measure:	Reduction in Crashes And Slowness complaints.

LOW-HANGING REPUTATION & GROWTH LEVERS

Google In-App Review API Integration

Current Reality: Reviews are largely unprompted or prompted at friction points (e.g. user review complaint: 'forcing me to give rating after every ride').

Recommendation: Trigger Google Play In-App Review API strictly after a high-satisfaction milestone: e.g., after 3 consecutive on-time trips completed without delay or dispute. Never prompt immediately after a delayed cab, cancelled booking, or app crash. Include an accessible in-app 'Report a Problem' button directly routing to the internal transport desk to intercept complaints before they reach the Play Store.

Human-in-the-Loop Developer Review Response SLA

Current Reality: Current reply rate on 1-2 star reviews is only 0.71%. Users feel abandoned.

Recommendation: Establish a dedicated 24-hour response SLA for all 1-2 star reviews. Every reply must be approved by a human operations lead (never automated canned bot responses). Acknowledge specific pain (e.g., 'We apologize for the delayed cab on your night shift'), provide a direct transport ticket ID, and invite them to update their rating once resolved.

Staged Rollout & Crash-Rate Gating

Current Reality: Version analysis revealed sharp rating drops on specific versions (e.g., v12.14.0 dropped to 3.37★).

Recommendation: Adopt strict phased rollout gates: 5% day 1, 15% day 3, 50% day 5, 100% day 7. Freeze rollout immediately if crash-free user rate drops below 99.5% or Play Console ANR (App Not Responding) rate exceeds 0.47%.
